

ECO-CEMENT

Austins Ferry scientist John Harrison, above, believes you can have development and look after the environment, too. His recyclable concrete — made mostly from waste — has only been developed in recent years, but it's attracting a lot of attention.

Made from waste ash from power plants — of which Australia dumps 8,000,000 tonnes a year — the cement is also low in carbon emissions so it's good for the greenhouse gas problem as well.
